Goal

- measure “warmup”
- completely unclear how

VMs

- Hotspot JVM
- Graal JVM
- JRuby Truffle
- V8
- LuaJIT
- HHVM
- PyPy
- CPython

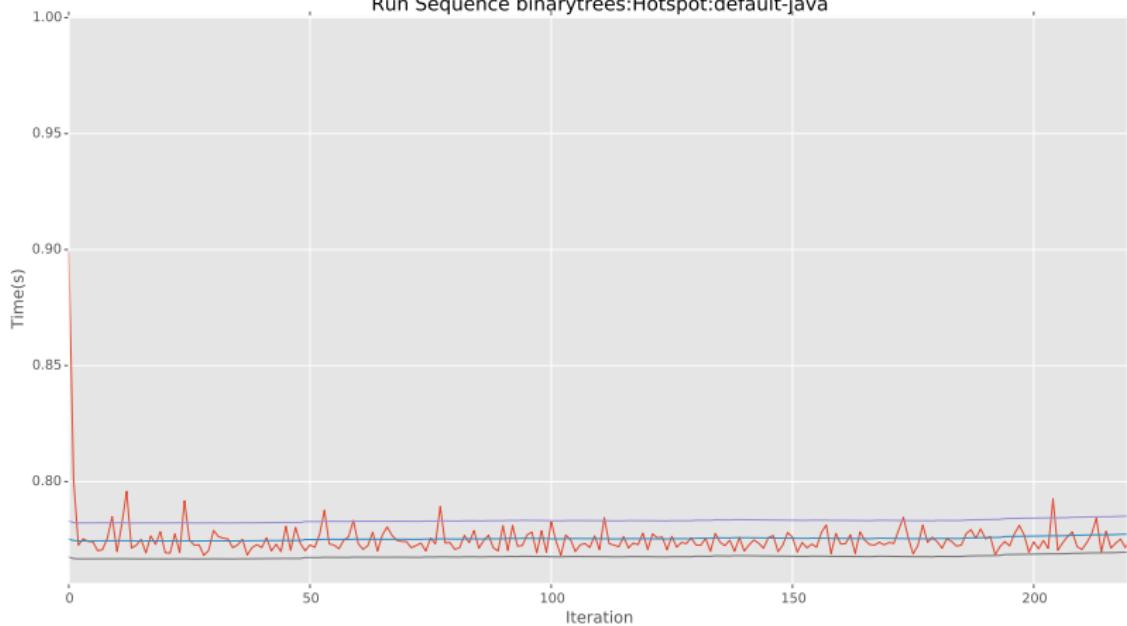

Benchmarks

- binarytrees
- fannkuchredux
- fasta
- nbody
- richards
- spectralnorm

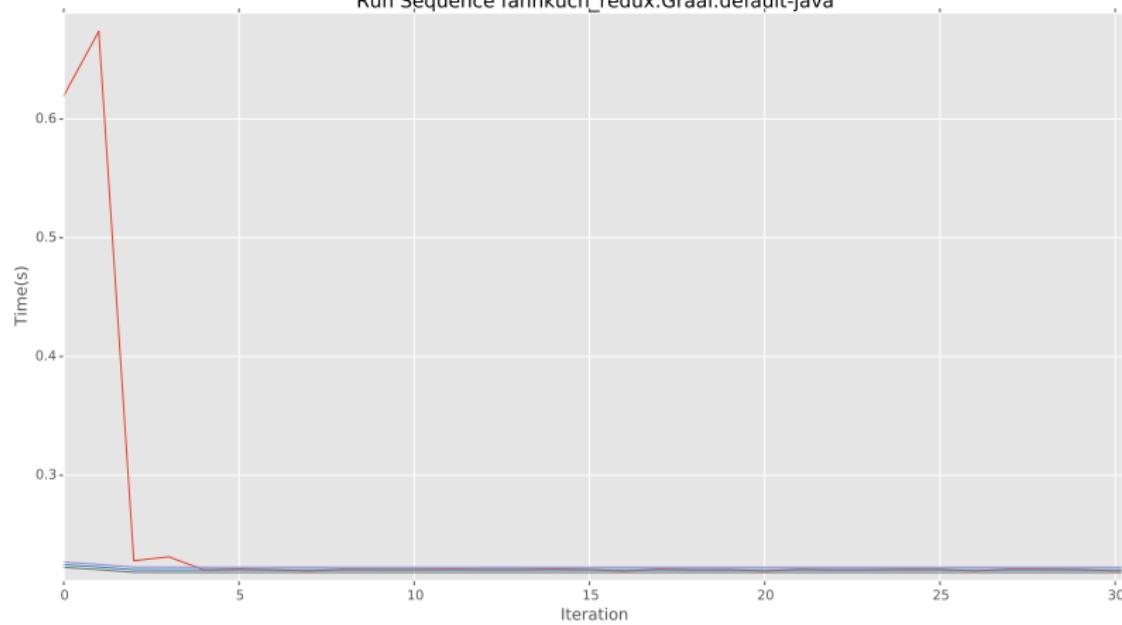

What we hope to see

- some slow iterations (ideally one)
- fast iterations
- maybe another slow one
- very fast ones, with some noise

Run Sequence binarytrees:Hotspot:default-java

Run Sequence fannkuch_redux:Graal:default-java

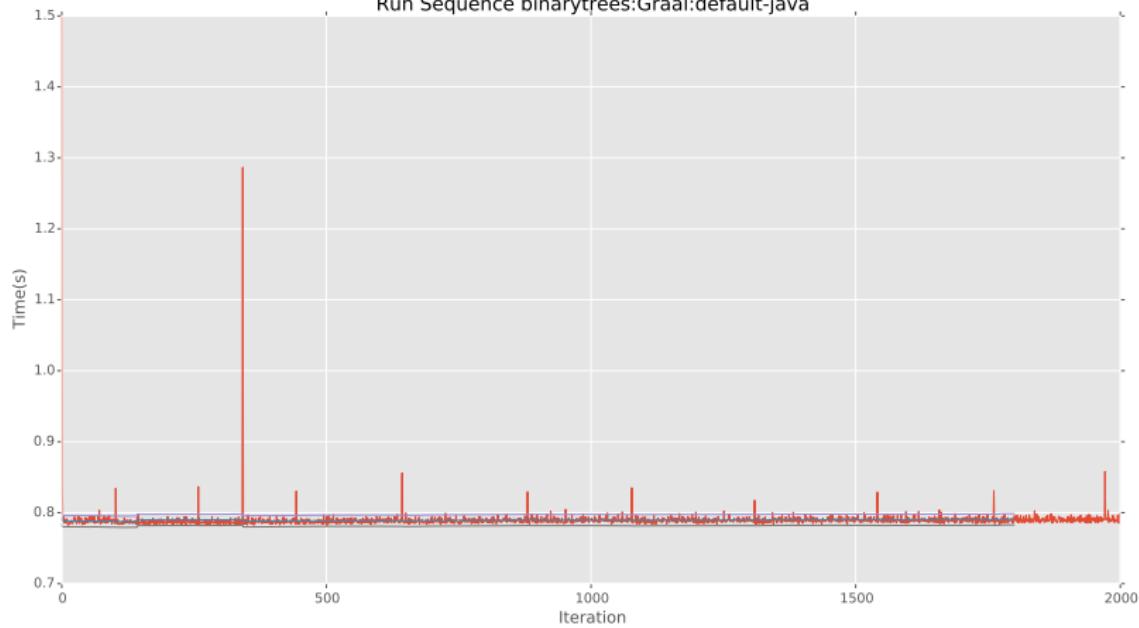

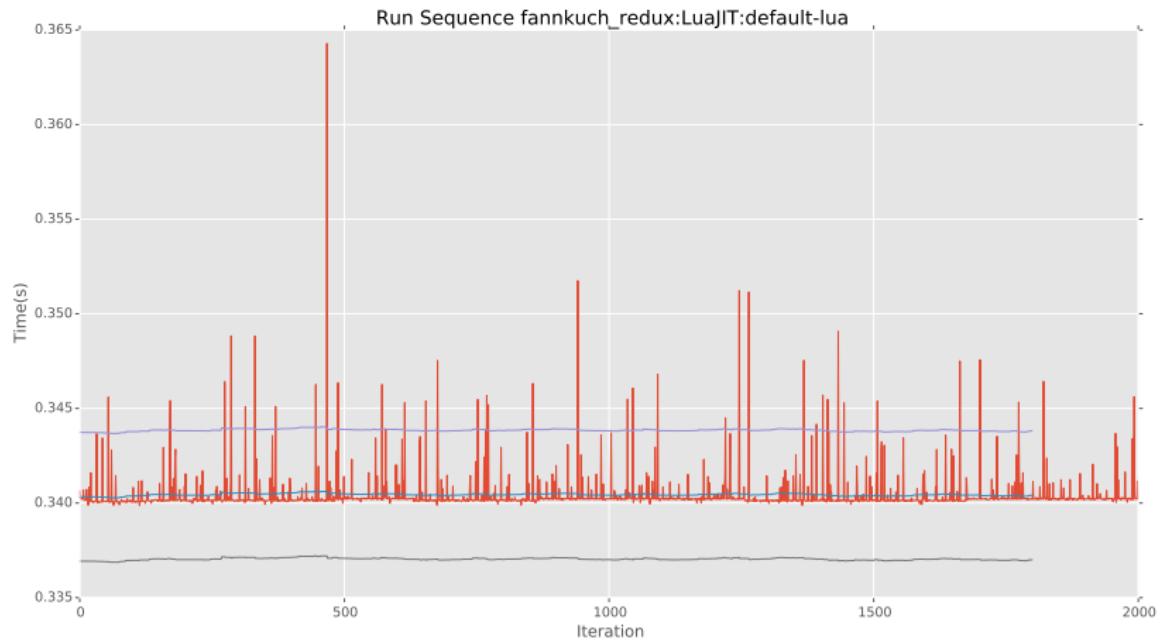

Weird things we find in practice

- outliers
- slowdowns
- late phase changes
- cyclic behaviour

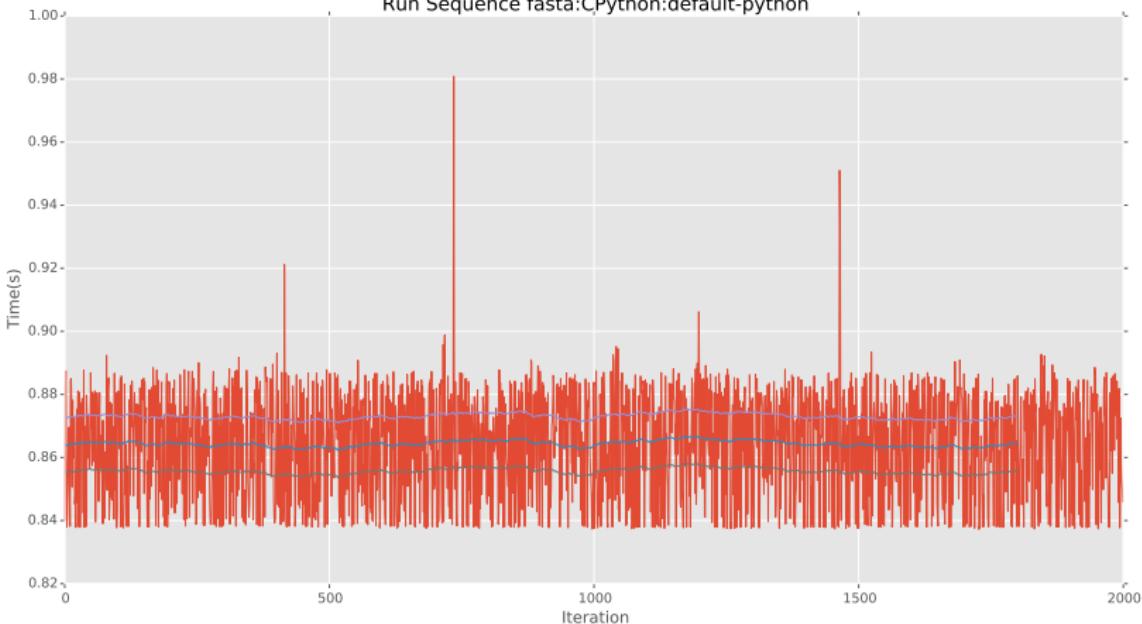

Outliers

Run Sequence binarytrees:Graal:default-java

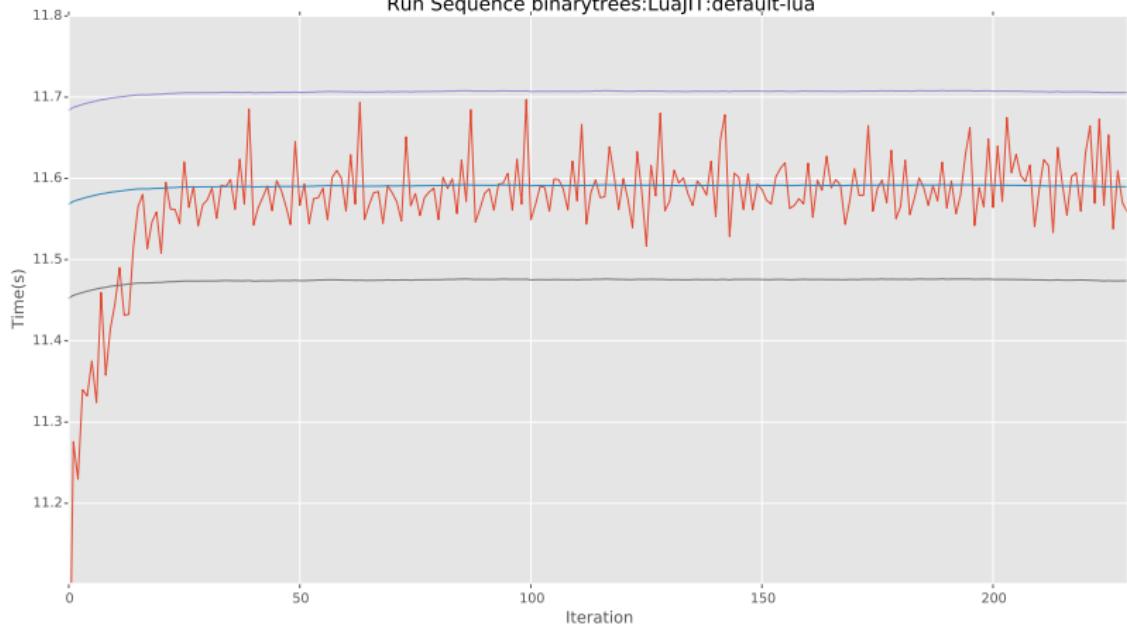

Run Sequence fasta:CPython:default-python

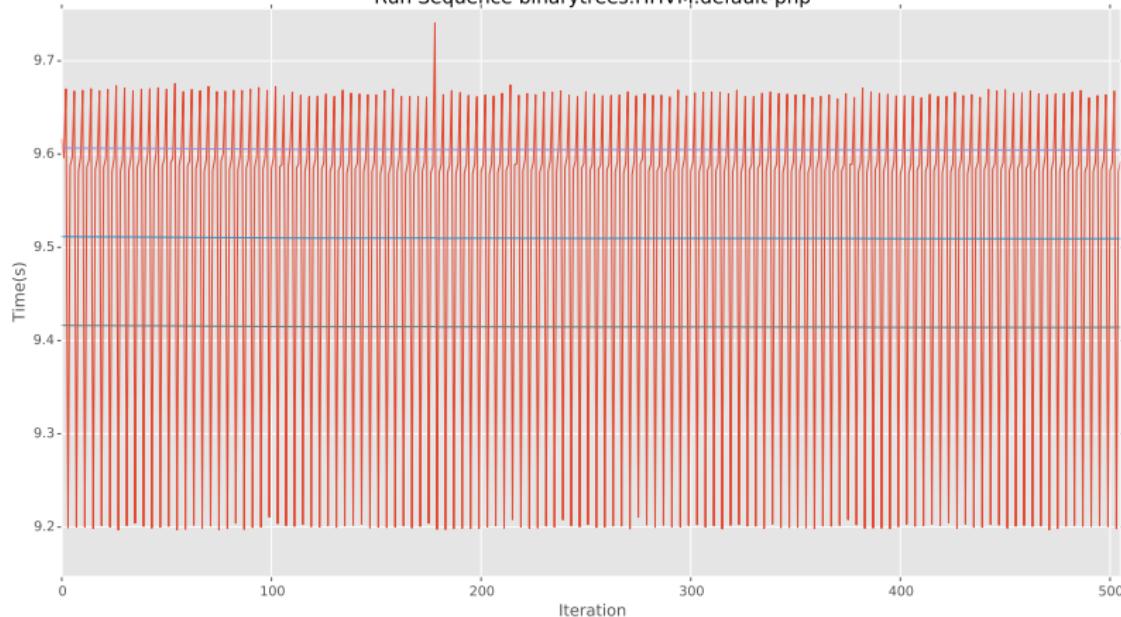

Slowdowns

Run Sequence binarytrees:LuaJIT:default-lua

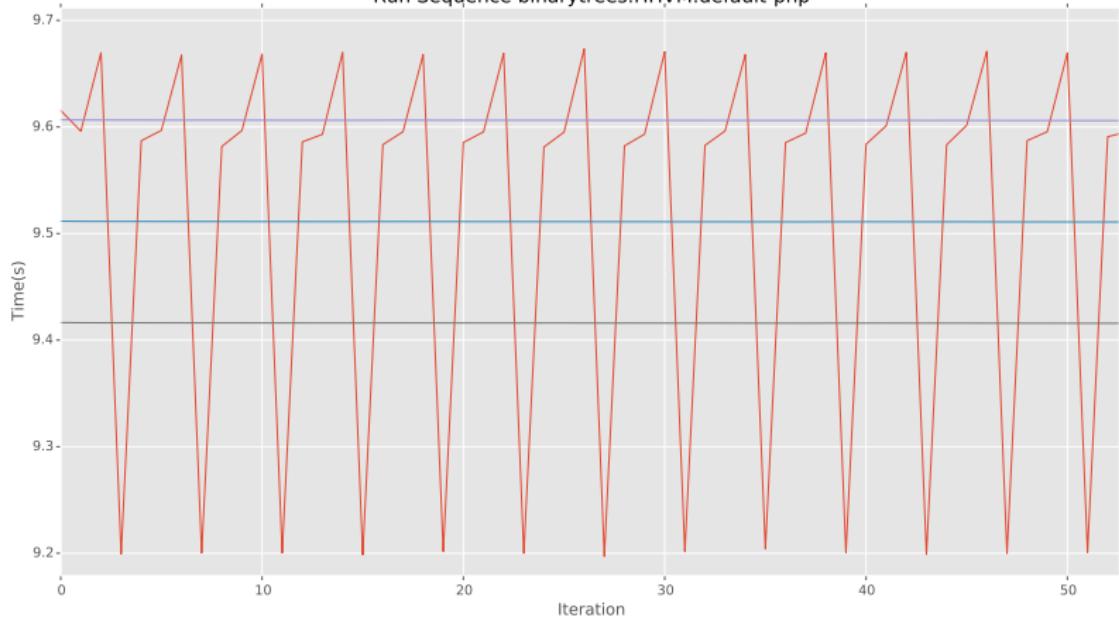

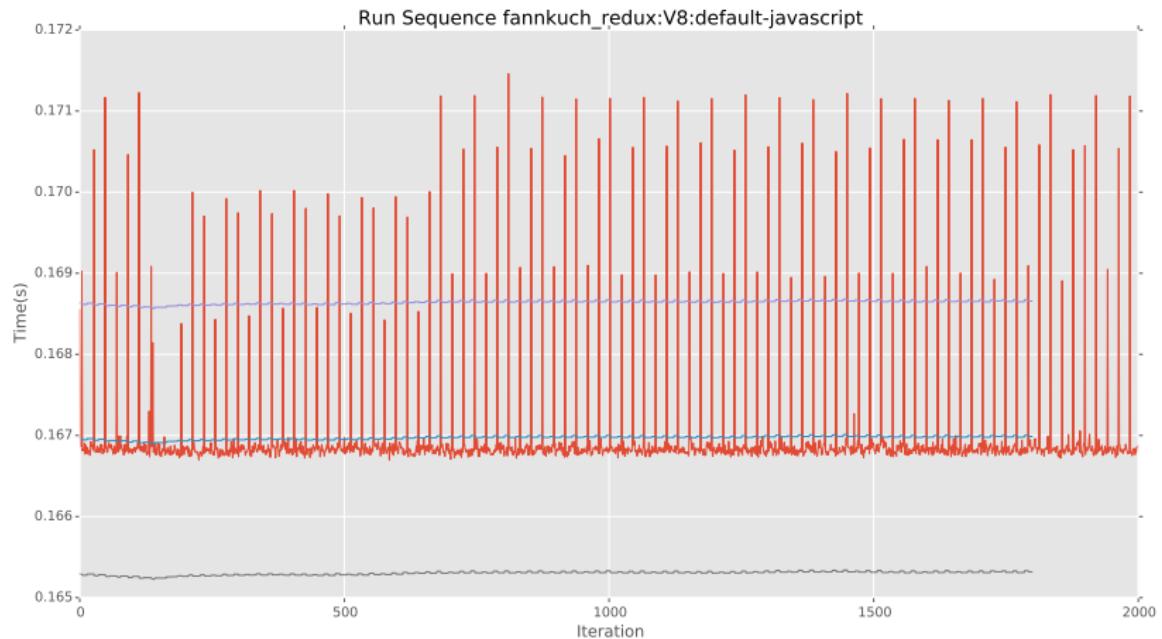

Cyclic behaviour

Run Sequence binarytrees:HHVM:default-php

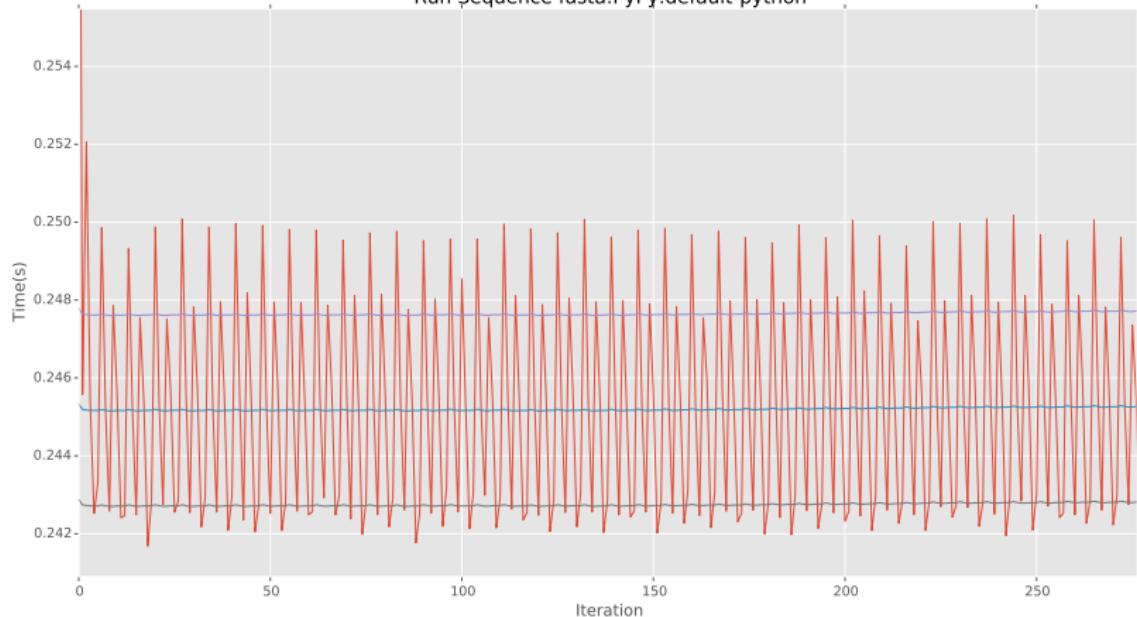

Run Sequence binarytrees:HHVM:default-php

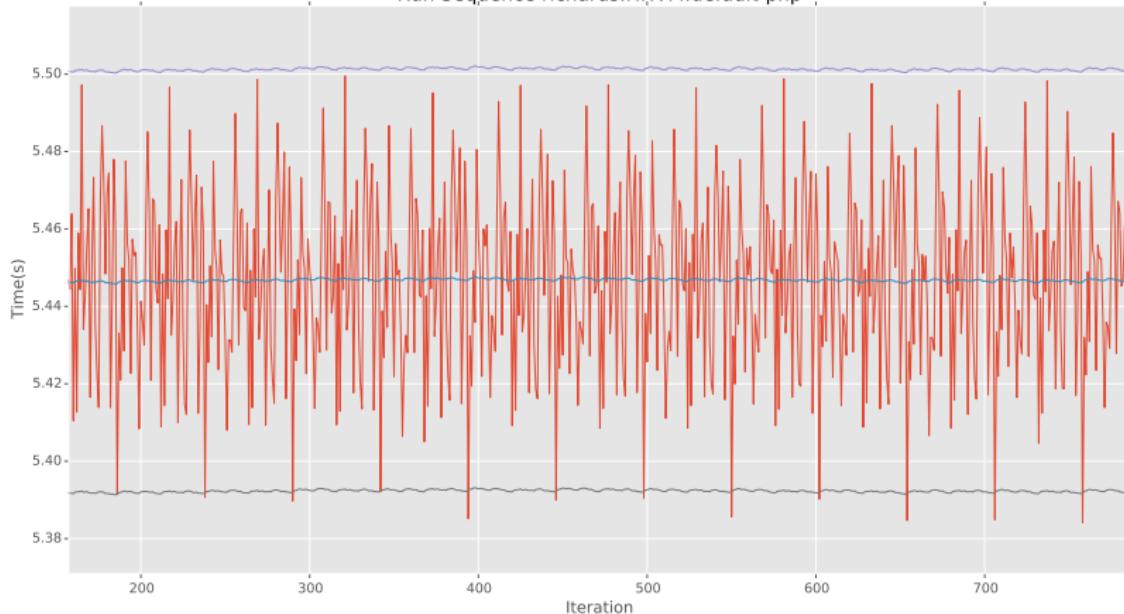

Run Sequence fasta:PyPy:default-python

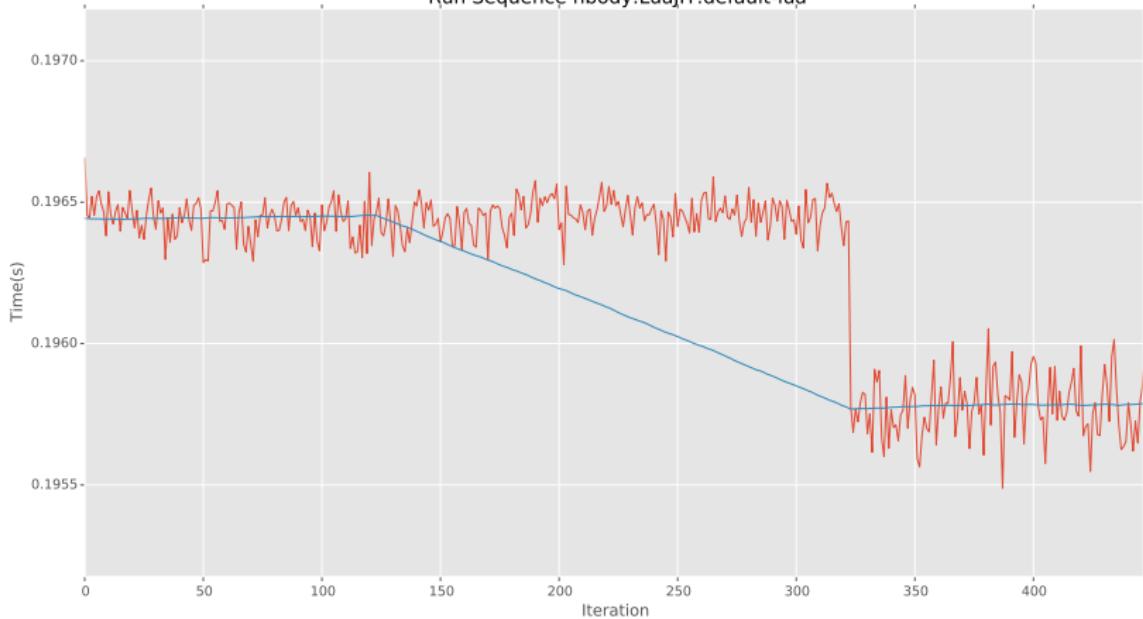

Run Sequence richards:HHVM:default-php

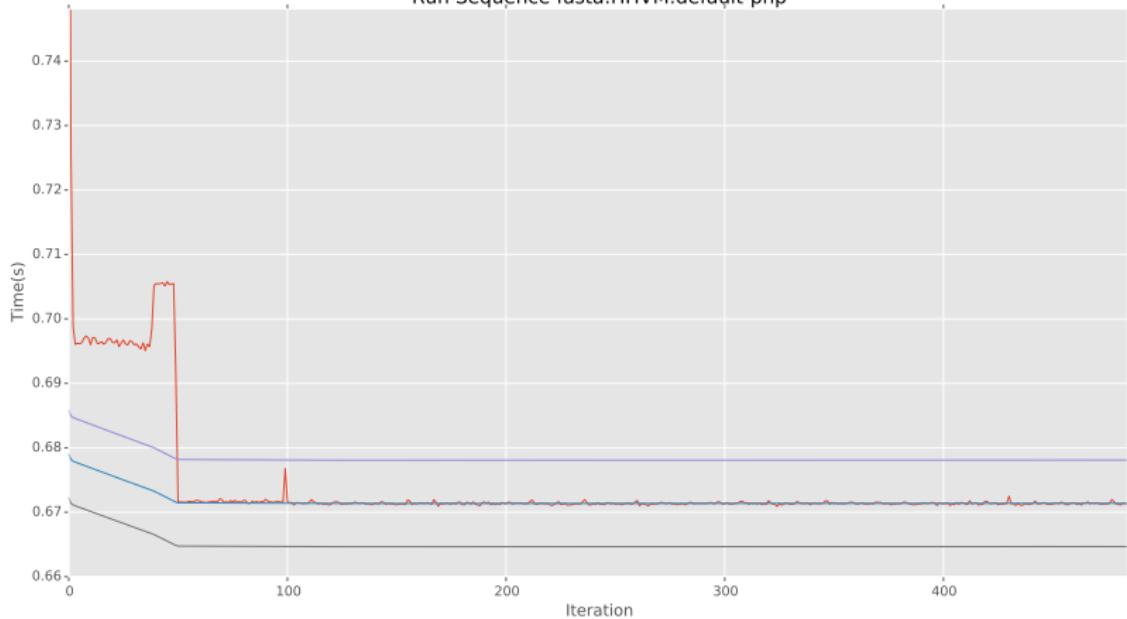

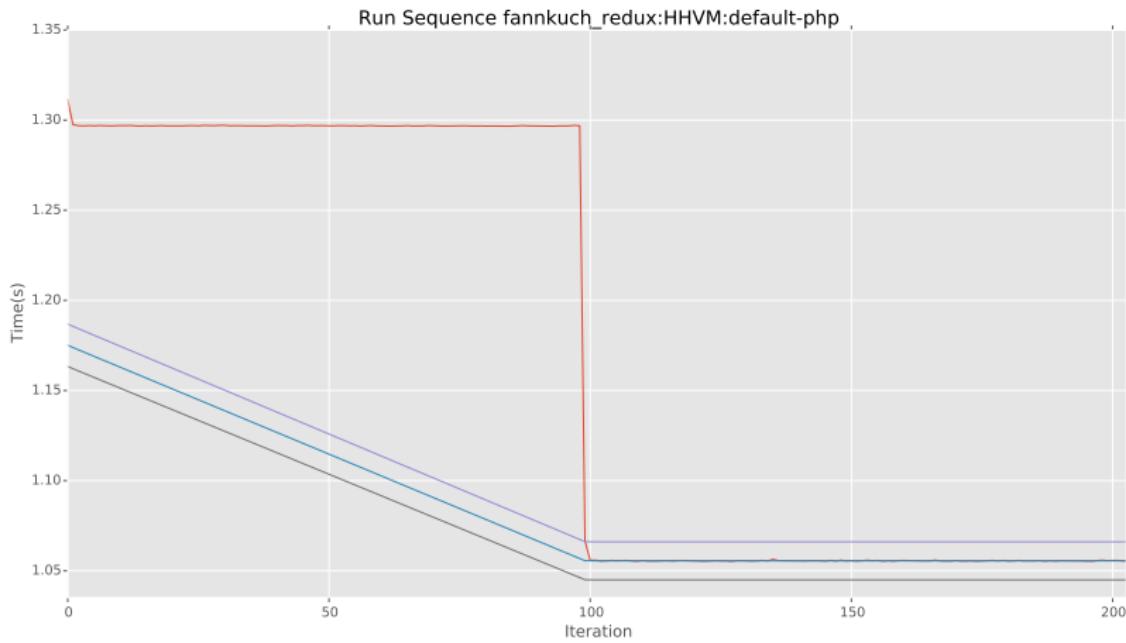

Late phase changes

Run Sequence nbody:LuaJIT:default-lua

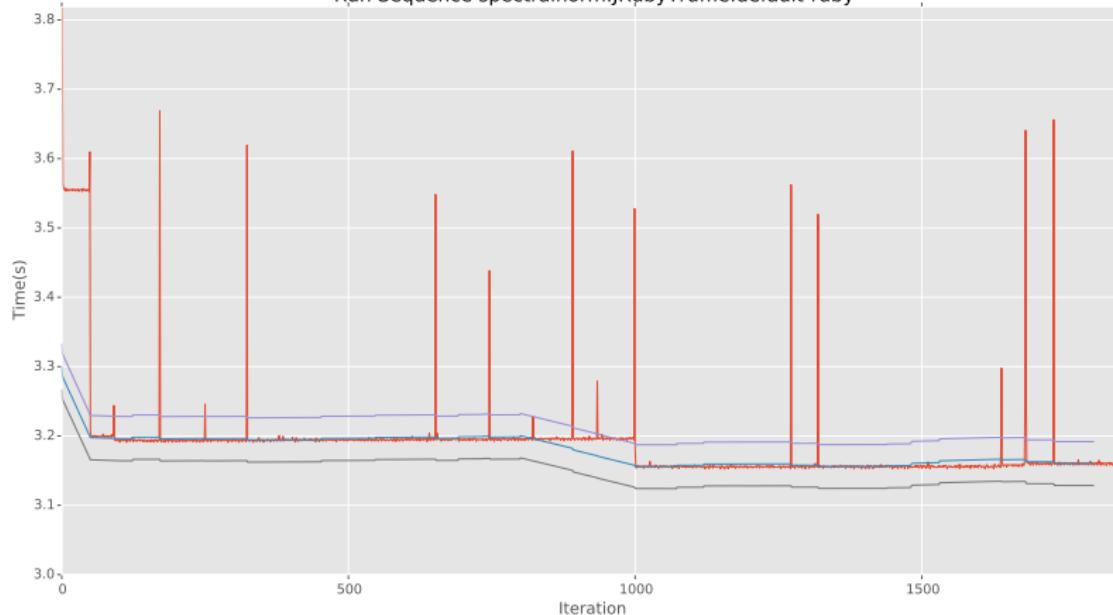

Run Sequence fasta:HHVM:default-php

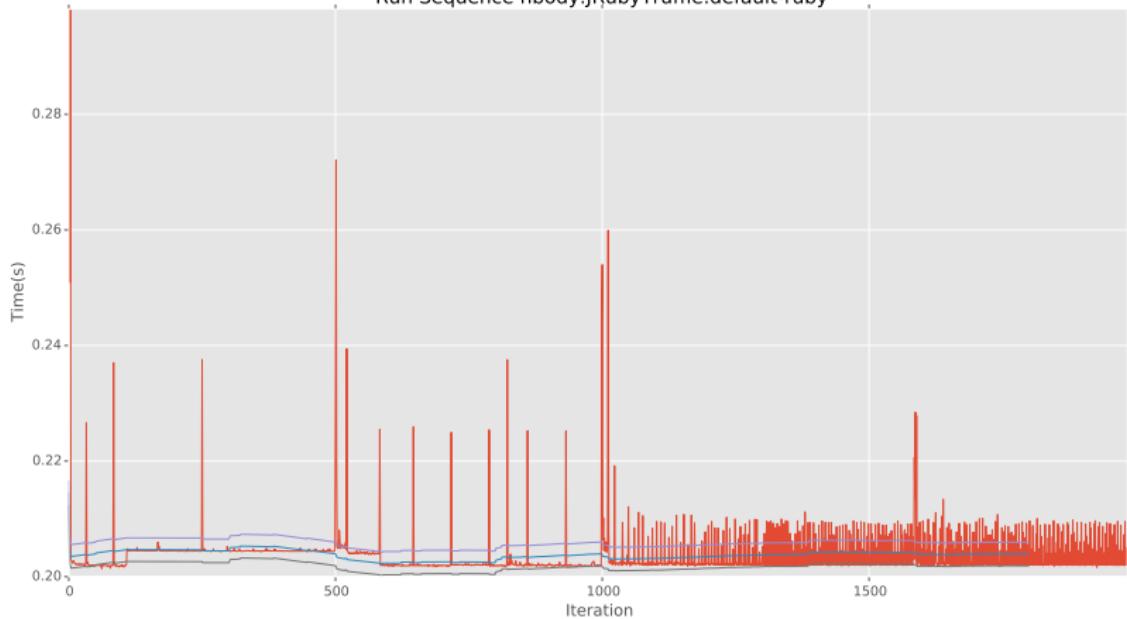

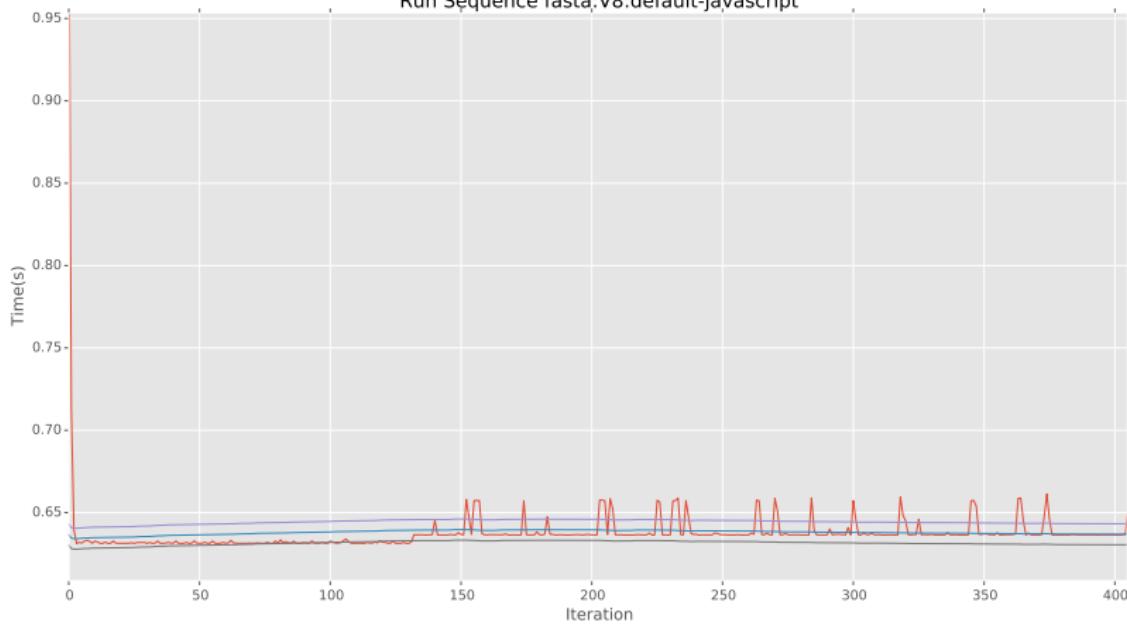

Run Sequence spectralnorm:JRubyTruffle:default-ruby

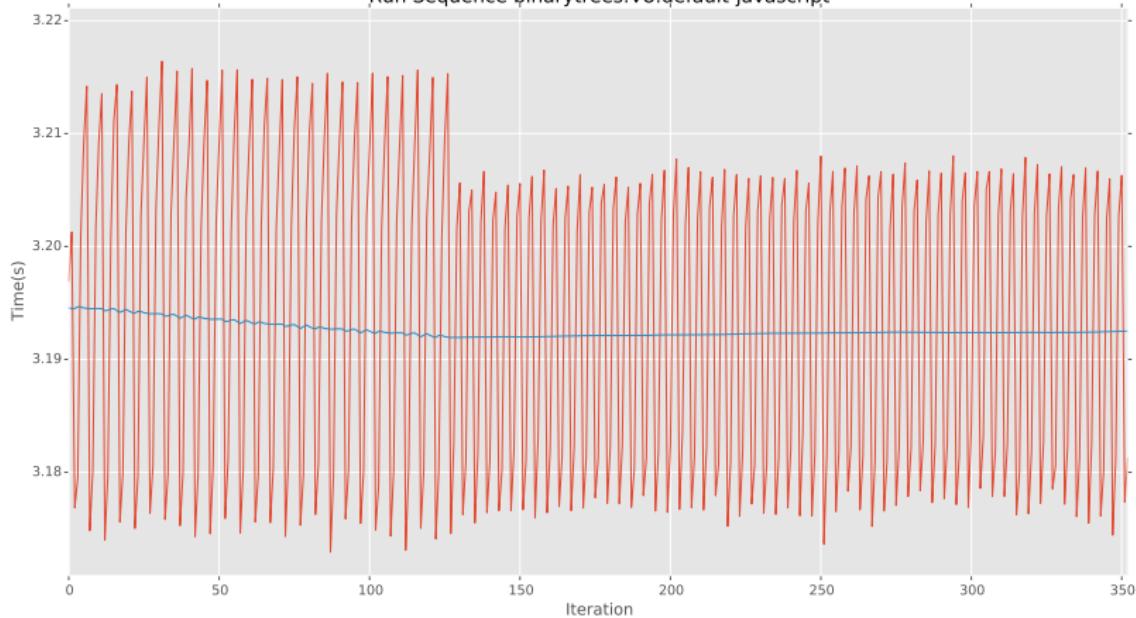

Run Sequence nbody:JRubyTruffle:default-ruby

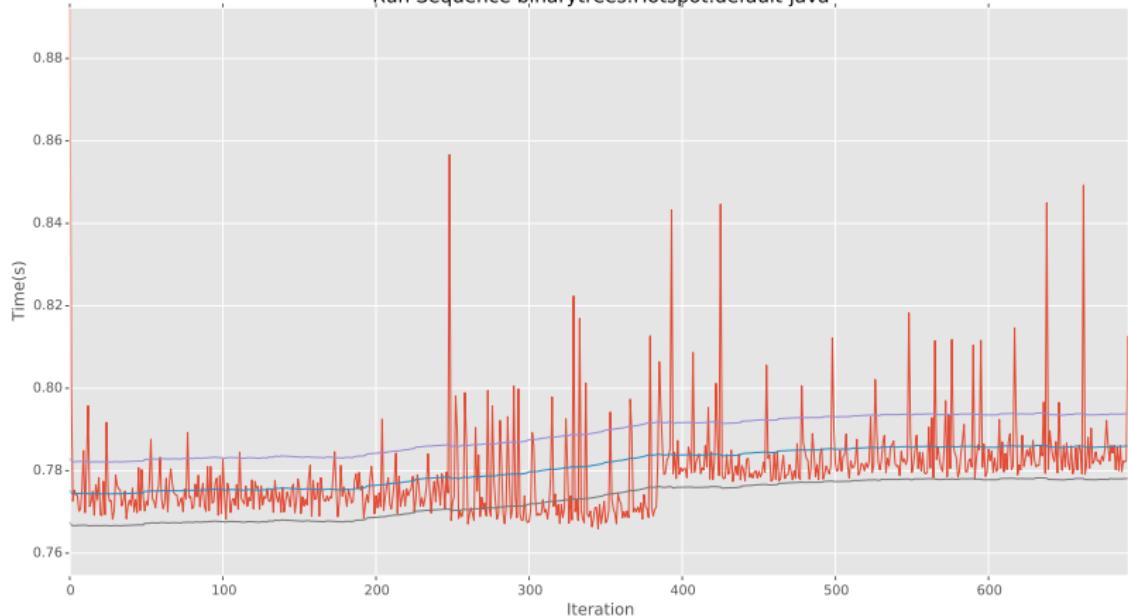

Run Sequence fasta;V8:default-javascript

Run Sequence binarytrees:V8:default-javascript

Run Sequence `binarytrees:Hotspot:default-java`

Now what?
